

**Project: Luxury Apartment, Knightsbridge**

**Client: Private**

**Sector: Residential**

**Duration: 11 Months**

**This 2 bedroom luxury Apartment in Knightsbridge, London incorporated 6 Televisions and 8 Audio zones including bathroom televisions and music**

**Due to the minimalistic design not one element of the audio visual system was placed in the actual rooms but rather based in a central communication area and then distributed over Cat6 cabling to each room for Television, and audio**

**This allowed each of the televisions to hang as “picture frames” and have no sign of wires or controllers**

**Due to a limited amount of space for storage and design, the entire communications system was located centrally and distributed HDMI over cat6 allowing usage of local furniture for usage over than storage of AV equipment and leads**

**It also allowed the 6 televisions to share the incoming satellite signals and channels**

**Mirrored Bathroom Televisions were installed to use as a vanity mirror and then as a television linked to the main central communications for a choice of Sky and Foreign Satellite and well as linking to the central music library**

**Stealth speakers were also used so that throughout the whole house not a single speaker could be seen. These speakers were installed in the fabric of the building, plastered over and then painted along with the rest of the room to completely hide the speakers without reducing sound quality**

**A Nuvo sound system was installed throughout with each room having a colour keypad showing the central music library by album cover, song, genre and even with a party mode for instant play throughout**

**These control units allowed sharing of a central library with the ability for everyone to play separate music on call from a local source**
